## Introduction to Probability Theory

---

### 1. Introduction

The term probability is related to the degree of certainty about a particular event of interest. We use the Kolmogorov Definition of Probability. In order to completely define Probability, we need to have knowledge of a few other terms.

**Definition 1.1** (Sample Space). The set of all possible outcomes on occurrence of an event is known as the Sample Space. It is denoted by  $\Omega$

**Definition 1.2** (Event Space). The collection of all events, or subset of possible outcomes ( $\Omega$ ) is known as the event space. An event space is also known as a  $\sigma$ -field or a  $\sigma$ -algebra (denoted by  $\mathcal{F}$ ) if it follows the following conditions

1. (Surety of an event)  $\Omega \in \mathcal{F}$
2. (Closure under complementation) For any event  $A$ ,  $A \in \mathcal{F} \iff \bar{A} \in \mathcal{F}$
3. (Closure under union) For any events  $A_1, A_2$ ,  $A_1, A_2 \in \mathcal{F} \implies A_1 \cup A_2 \in \mathcal{F}$

**Note.** Closure under intersection is implied as  $A_1 \cap A_2 = \overline{\bar{A}_1 \cup \bar{A}_2}$

### 2. Probability Function

We can now formally define Probability or Probability Measure

**Definition 1.3** (Probability Measure). Probability Measure defines a function on a  $\sigma$ -field —  $\mathbb{P} : \mathcal{F} \longrightarrow [0, 1]$  which satisfies the following conditions

1.  $\mathbb{P}[\Omega] = 1$
2. If  $\{A_n\}$  is a set of pairwise disjoint events  $\in \mathcal{F}$ , then

$$\mathbb{P}\left[\bigcup_n A_n\right] = \sum_n \mathbb{P}[A_n]$$

**Result 1.3.1** (Inclusion-Exclusion Principle). For events  $\{E_n\}_{n \in [N]}$ , we can say

$$\mathbb{P}\left[\bigcup_{n \in [N]} E_n\right] = p_1 - p_2 \cdots + (-1)^{n-1} p_n$$

$$\text{where } p_r = \sum_{1 \leq i_1 < \cdots < i_r \leq n} \mathbb{P}[E_{i_1} \cap E_{i_2} \cdots \cap E_{i_r}]$$

**Result 1.3.2.** For events  $\{E_n\}_{n \in [N]}$ ,

(i)

$$\mathbb{P} \left[ \bigcup_{n \in [N]} E_n \right] \leq \sum_{n \in [N]} \mathbb{P}[E_n] \quad (\text{Boole's Inequality})$$

(ii)

$$\mathbb{P} \left[ \bigcap_{n \in [N]} E_n \right] \geq \sum_{n \in [N]} \mathbb{P}[E_n] - (n - 1) \quad (\text{Bonferroni's Inequality})$$

**Definition 1.4** (Probability Space). The triplet  $(\Omega, \mathcal{F}, \mathbb{P})$  of a set of outcomes, a valid  $\sigma$ -field and a valid probability measure constitutes a probability space.

**Definition 1.5.** Let  $\{E_n\}_{n \geq 1}$  be a sequence of events. Then the sequence is said to be

(i)  $(E_n \uparrow)$  *increasing* if  $E_n \subset E_{n+1}$ ,  $n = 1, 2, \dots$ . In this case,  $\lim_{n \rightarrow \infty} E_n = \bigcup_{n \geq 1} E_n$

(ii)  $(E_n \downarrow)$  *decreasing* if  $E_{n+1} \subset E_n$ ,  $n = 1, 2, \dots$ . In this case,  $\lim_{n \rightarrow \infty} E_n = \bigcap_{n \geq 1} E_n$

The sequence is said to be a *monotone* if either  $E_n \uparrow$  or  $E_n \downarrow$

**Result 1.5.1.** Let  $\{E_n\}_{n \geq 1}$  be a monotone sequence of events, then

$$\mathbb{P} \left[ \lim_{n \rightarrow \infty} E_n \right] = \lim_{n \rightarrow \infty} \mathbb{P}[E_n]$$

**Exercise 1.1.** Prove Result 1.5.1

**Definition 1.6.** For a collection of events  $\{E_n\}_{n \in [N]}$ ,

(i) the events are said to be mutually (or pairwise) exclusive if  $E_i \cap E_j = \emptyset \forall i \neq j$

(ii) the collection is said to be exhaustive if  $\mathbb{P} \left[ \bigcup_{n \in [N]} E_n \right] = 1$
